

ATLAS

Asset Tracking and License Acquisition for Software

Federal organizations spend billions of dollars on software tools each year, but they often lack a holistic view of their software portfolio. Federal leaders are trying to answer questions like:

- If I had a dollar to spend, where should I spend it?
- How well are we utilizing the licenses we have?
- What software capabilities are redundant, what can we deduplicate?
- Which software platforms are reaching end of life?

ATLAS is a low-code, automated software license and procurement management tool that solves common challenges for federal leaders by providing them with a complete view of their software portfolio and streamlining the software procurement process. ATLAS supports organizations by optimizing their lifecycle software management and maximizing each taxpayer dollar spent through cost reductions.

Remove Request Confusion

ATLAS has a web-based platform for users to view the software catalog, request new software, and offers managed user permissions, budget, and more.

Streamlined Procurement

The automated approval workflow streamlines the request to delivery. ATLAS routes new requests through the approval channels, and delivers to the procurement point of contact for next steps, based on the set evaluation criteria.

Integrated Security

Security checks are embedded throughout the procurement and management process to ensure compliance with your specific environment.

360 Visibility

ATLAS provides visibility into the requests, usage, inventory, security, and financials. Allowing managers to see a full view of their software portfolio through concise dashboards.
